

# Polished Concrete Maintenance

## Daily Maintenance

1. Dust mop larger debris off of the floor
2. Auto Scrub with soft white pads and water

## Weekly Maintenance

Once or twice a week add cleaner to the water tank, you need to use a polished concrete cleaner that has a neutral acidity to concrete. There are multiple options on the market, we prefer the Prosoco DailyKlean. We sell this at LDL but it may also be available locally.

When using the Daily Klean continue to use the same soft white cleaning pads, you do not want to use coarse pads or brushes because they will wear down the polished finish.

## Periodically As Needed

Polished concrete guards are thin, breathable, guards that let moisture out and bond to a high gloss surface. With that said, they are not a permanent coating and need re applied from time to time. For high traffic areas, once a year is recommended. Before applying the guard auto scrub the floor, burnish the floor with a diamond impregnated pad, generally an 800 grit, apply the guard and burnish it with a 1500 grit pad.
